** the "Style" Column refers to how the simulator is mounted on the wheel: "lug mount" simulators are actually held on by the lug nuts of the vehicle, while "over the lug" (OTL) simulators are held on by a series of lock nuts threaded on to the end of the vehicle's studs

RING MOUNT SIMULATORS

17.5", 19.5" & 22.5" Ring Mount

Kaper's unique and patented ring mount system, can be used on both dual wheels & rims, and is installed using an expanding and locking ring inside the wheel's rim contour. Front styles have a highly positive offset (like a front "Budd" type) and the rear style has a less positive offset to imitate a rear drive or trailer application. Security screws hold the cover in place.
